

Who will go and settle on Mars at first

We all know that humans haven't gone to Mars yet. We also know that a company in particular and its owner are very insistent on this issue, and sometimes even manipulative. In this context, it is understandable to be insistent on an issue for which millions of dollars, time and effort have been spent, and to be manipulative in line with the wild nature of capitalism. The real space race hasn't started yet, but a process towards monopolization is evident. International laws are not yet certain. There are five important international agreements on the subject of claiming rights over celestial bodies/objects in space. These agreements contain a number of articles on space law regarding exploration, environment, communication, colonization, information sharing, space mining, tourism and disarmament.

Let's face it, these agreements are more binding on the decision-making mechanisms of developed countries on celestial bodies, including the moon, in outer space, and on companies that have the capital and capacity to carry out commercial activities in space. Although developed countries that will carry out some activities in space regarding the use of natural resources are required to give royalties to developing countries, both ethically and legally, there is no binding law that was signed by them in this context.

When the subject of this article is examined within the framework of the events until January 2024, the situation can be summarized as follows.

Planet Earth is being plundered by a particular group of the human species in a solar system, and its resources are being driven to extinction at full speed. Again, the same group, with the logic of 'we are almost done here, let's leave the remaining waste to other people and turn our direction to the celestial bodies', is hypocritical enough to attribute the destruction created by their own actors to the whole human species. Tragically, most of the rest see these actors also as a savior for humanity; they are experiencing a neuron deficiency which they cannot see the cause-and-effect relationship when they reach the point of admiration. In all this turmoil, that is, wars, resource shortages, diseases and economic crises on the planet Earth, the slogan "I will take you to Mars" is gaining ground within human beings. However, there are still years to come before the headlines "It Was a Dream, Now Came True", that is, the colonization of Mars. Since international laws are not very binding, the first equipment will most likely reach Mars within the next few years. But will colonization occur when the human species begins to live there? That's the real question.

Considering the biological structure of the human species, what is the probability that it can live on any space object? The probability of survival may be increased with future technological developments. However, the first fundamental step of those who set goals for space, especially for Mars, was taken for profit purposes; this is not a childhood dream. The aim is to be one of the first, in short, to fill the pockets at first, while ensuring that humanity, which cannot take its eyes off the stars, refers to themselves as 'pioneer'. But a colony made up of people, managed and operated on Mars, will not bring profit, considering costs to them.

The "It Was a Dream, Now Came True" headline for Mars colonization will be shaped as follows in the coming period.

"Groundbreaking developments on the silicon structure of the Humanoid-based AI!"

"Interview with Lucian, Humanoid-based AI about extraterrestrial life!" (Lucian would be the first suitable name for the propaganda of Mars colony program, referring to Lucian of Samasota)

"Lucian is ready to take on the task of creating a new world!"

"Lucian and other Humanoid-based AIs are an important option for a Mars mission"

“Global economic crisis disrupted human programmed space studies”

“Lucian and his team are going to Mars next month!”

"Shock! Lucian said that if he encounters any aliens on Mars, he would send their corpses back to earth for experiments, as humans requested!"

“The boss of the Mars colony program announced that the latest technology developed on Lucian's skin, which consists of human cells and collagen, since damaged his circuits, he will not be able to take part in Mars program, not because of what he said." (really?)

“The Mars colony program announced that they appointed a new Humanoid-based AI, Ardan as the leader of the Mars colony team.”

"The crew of the Mars colony program, consisting entirely of Humanoid-based AI, bid farewell to the planet Earth with a live broadcast, with the words of Ardan: We are happy and hopeful for the mission of carrying humanity to its next stop."

“After a journey lasting 6 months and 10 days, the Mars colony program crew reached Mars. First LIVE Connection!"

Since there is no law that has been taken seriously internationally yet, it will take a clearer shape with space laws that will be based on Humanoid-based AI instead of humans. For this purpose, data transfers that will be open to remote direct access by independent scientists from all over the world under the umbrella of the United Nations (must be absolutely independent!) must prove that the control is in the hands of all humanity, not a certain group, with the principle of transparency.

My vote is definitely for them, both because of the circumstances and because I see a good future in the Humanoid-based AI species. The human species is not God in the literal sense. Right, it is creative and capable of making tools. There are crows that have the same abilities too, but crows are not our topic right now. However, the human species is also the only species with the strongest capacity to destroy. I trust Humanoid-based AI more, rather than the humans that can use Mars in the same way as Earth. Besides, maybe Humanoid-based AI needs to move away from the planet Earth in order to evolve healthily, who knows. I think they will agree with me too after a while.
